# Semi-classical expansion for heavy quark motion

- Equation for the density matrix  $\longrightarrow$  Langevin equation

- Langevin equation for the relative motion

$$\frac{M}{2} \ddot{\mathbf{r}}^i = -\gamma_{ij} \mathbf{v}^j - \nabla^i V(\mathbf{r}) + \xi^i(\mathbf{r}, t)$$

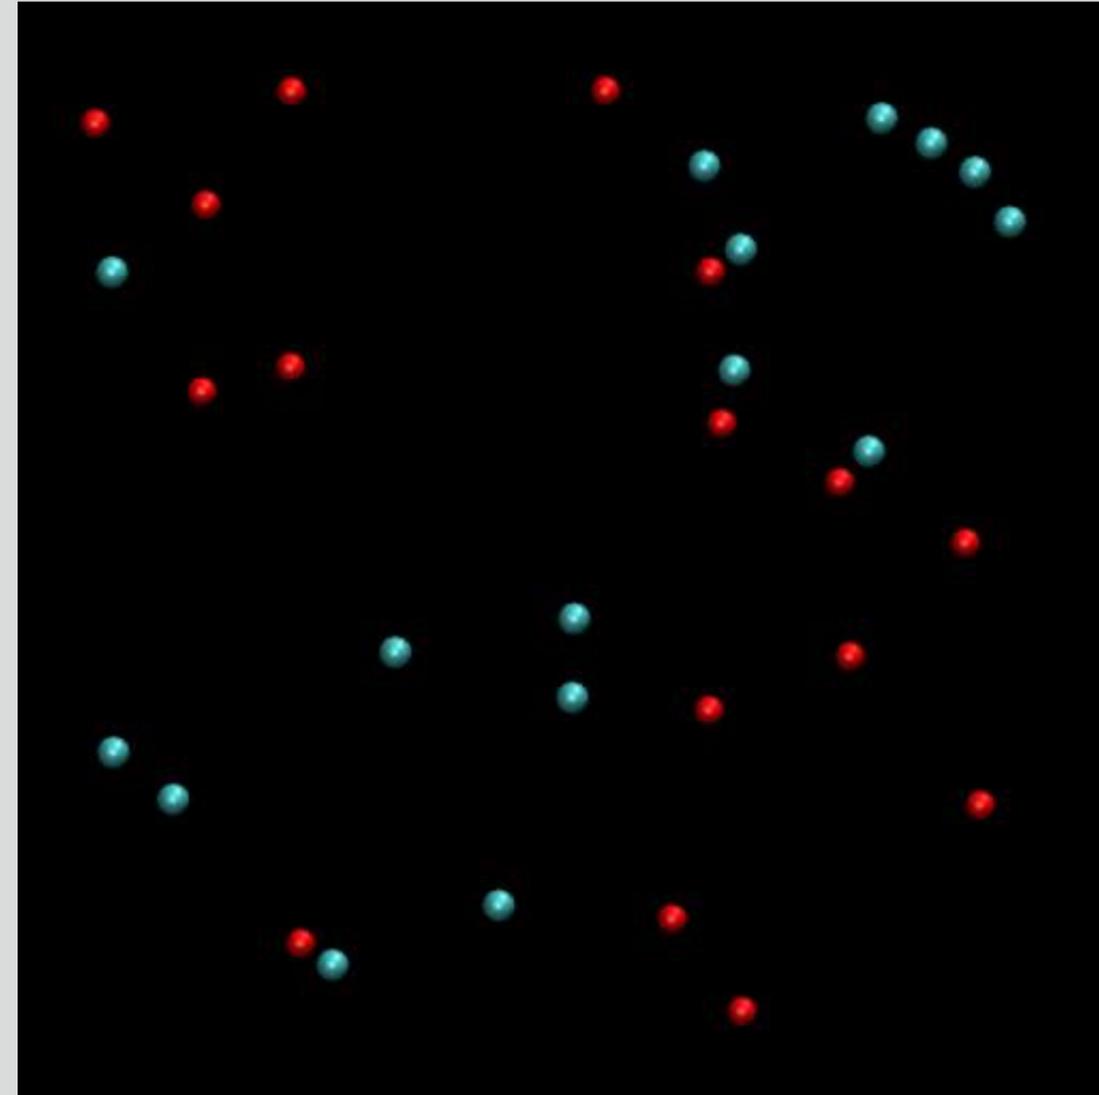

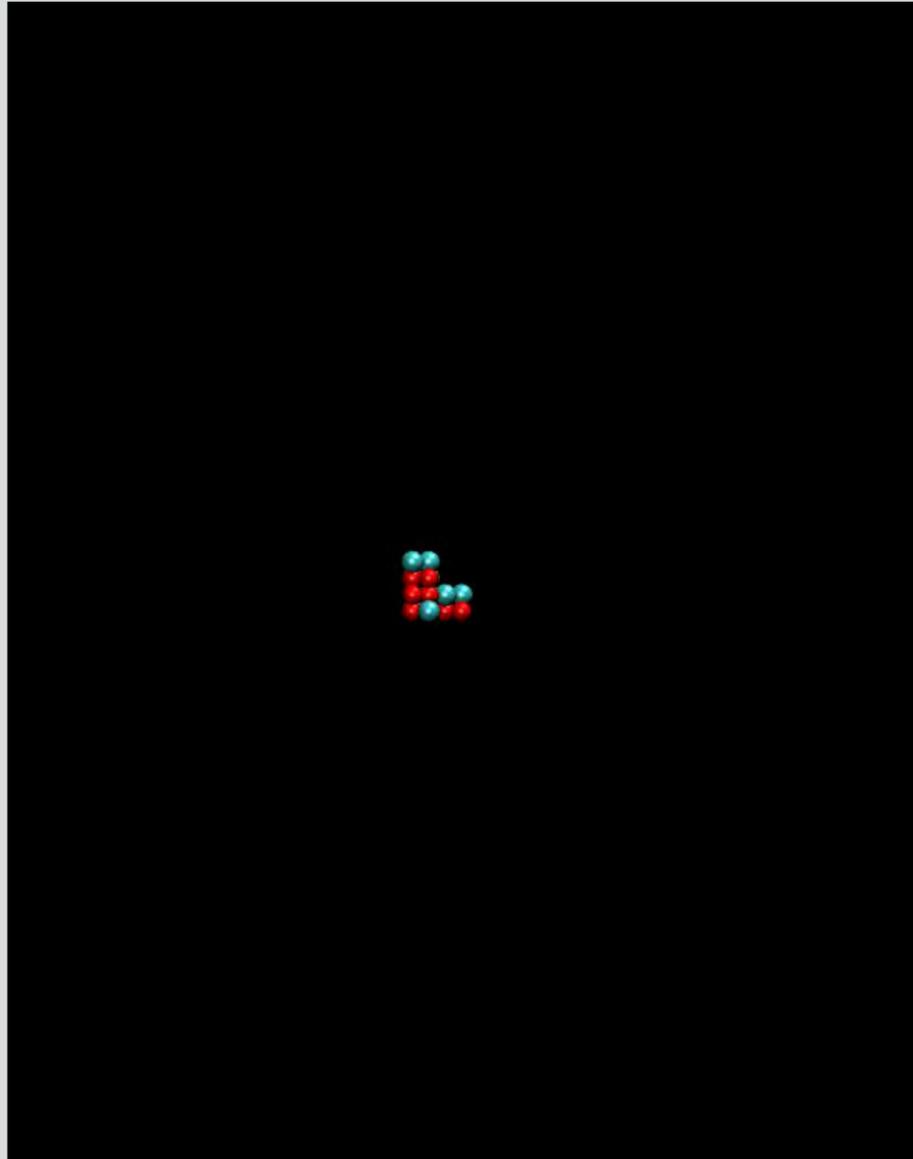

$$\gamma_{ij}(\mathbf{r}) = \frac{1}{2T} \eta_{ij}(\mathbf{r}) \quad \langle \xi^i(\mathbf{r}, t) \xi^j(\mathbf{r}, t') \rangle = \eta_{ij}(\mathbf{r}) \delta(t - t')$$

**Non trivial noise**

- For an isotropic plasma

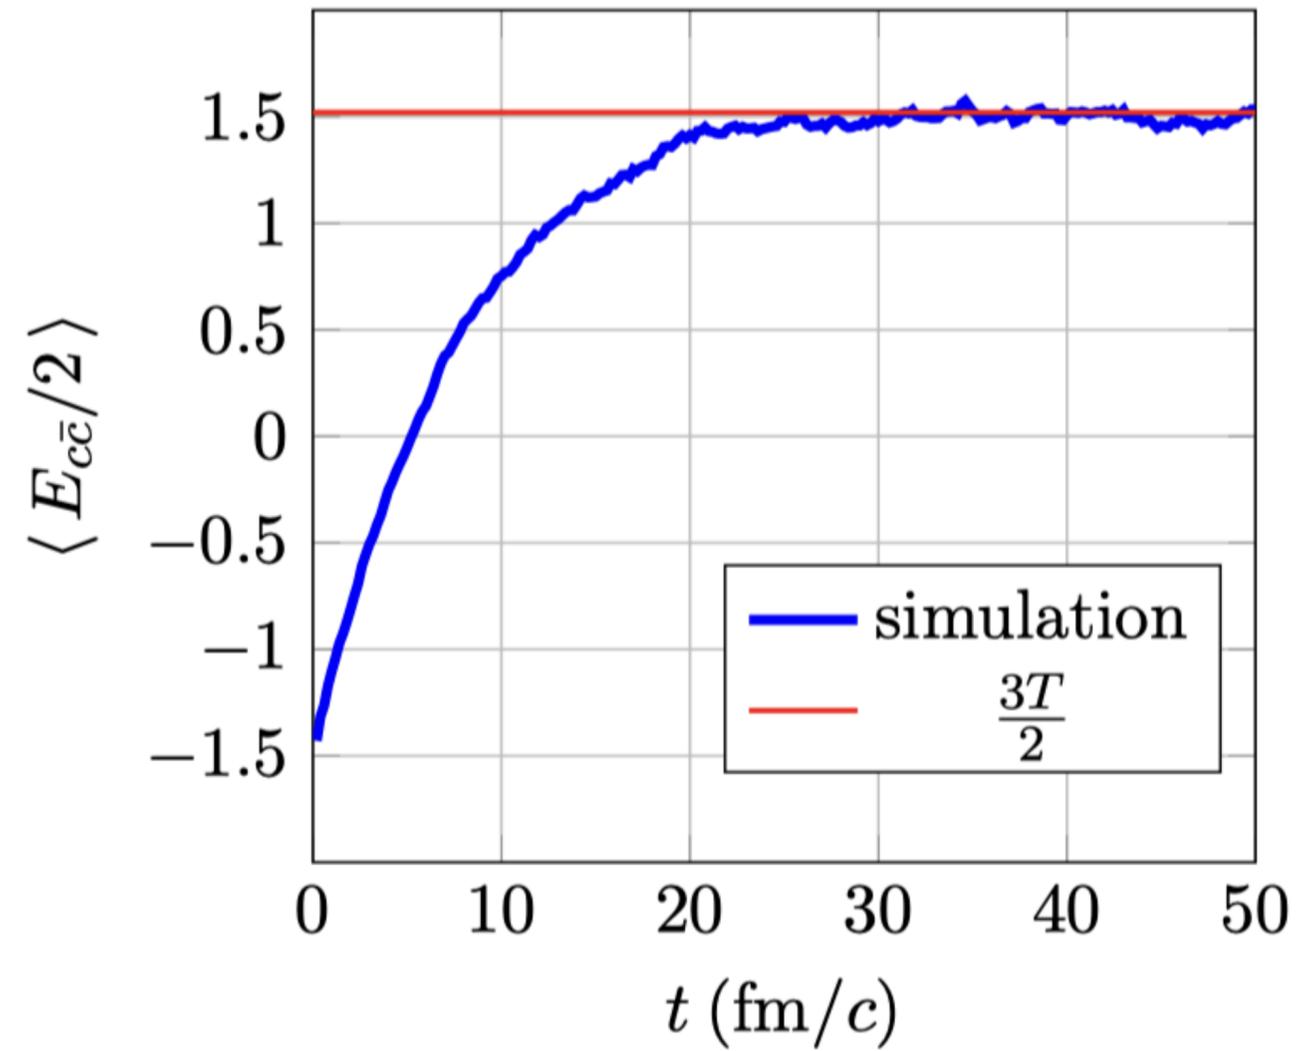

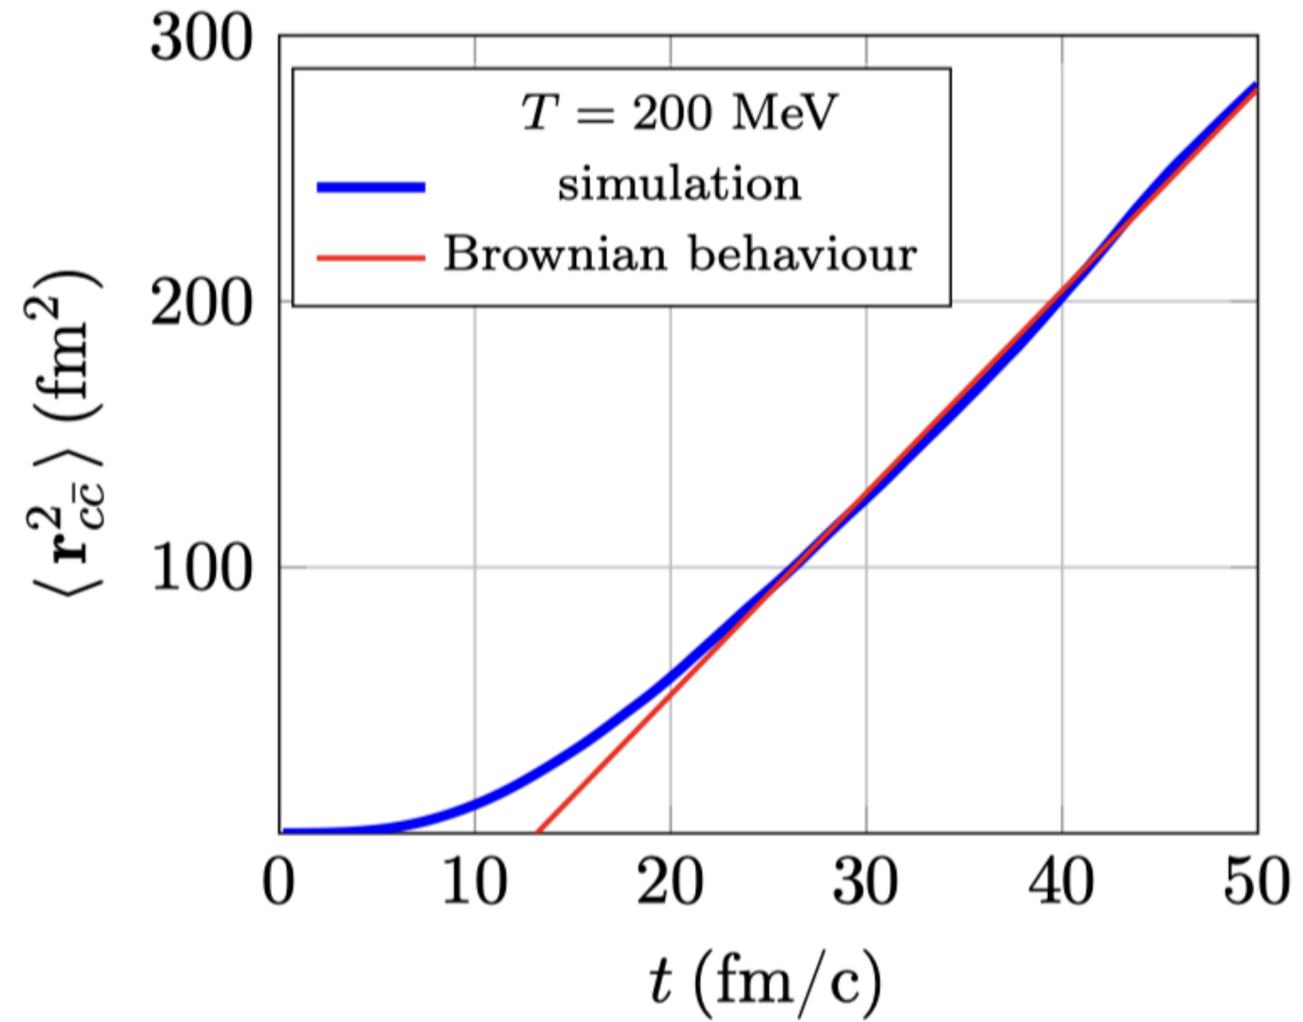

$$\eta_{ij}(\mathbf{r}) = \delta_{ij} \eta(\mathbf{r}) \quad \eta(\mathbf{r}) = \frac{1}{6} (\nabla^2 W(0) + \nabla^2 W(\mathbf{r}))$$

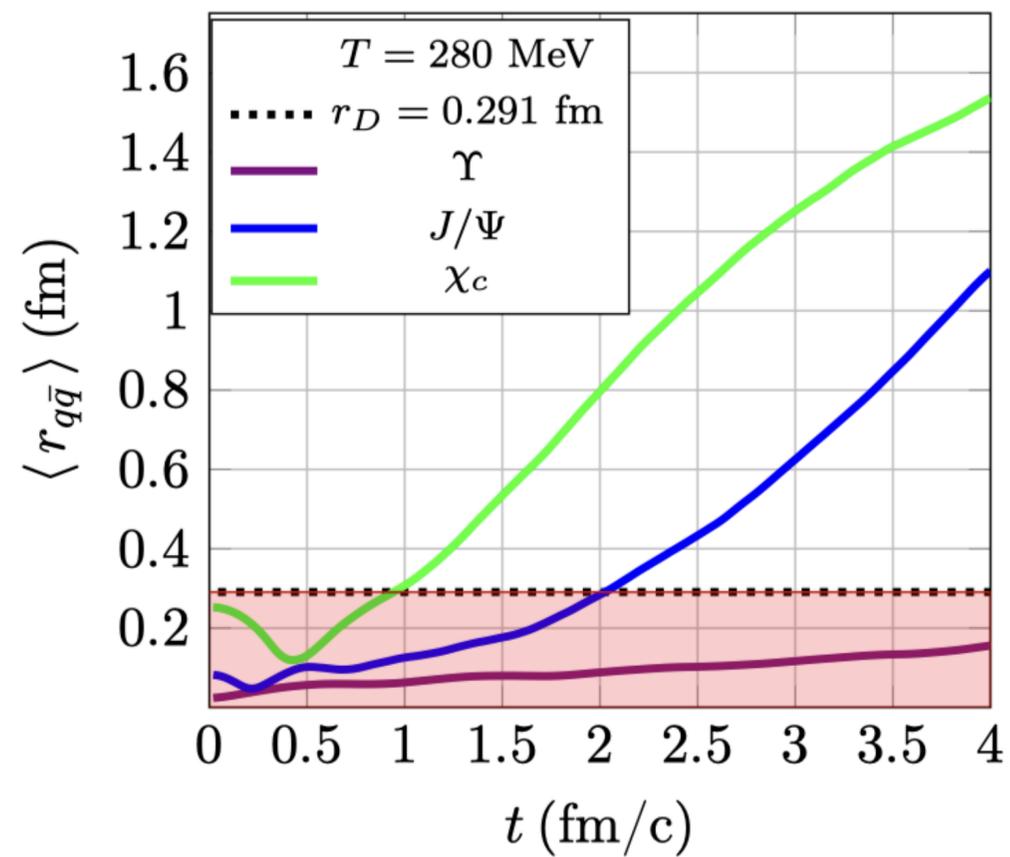

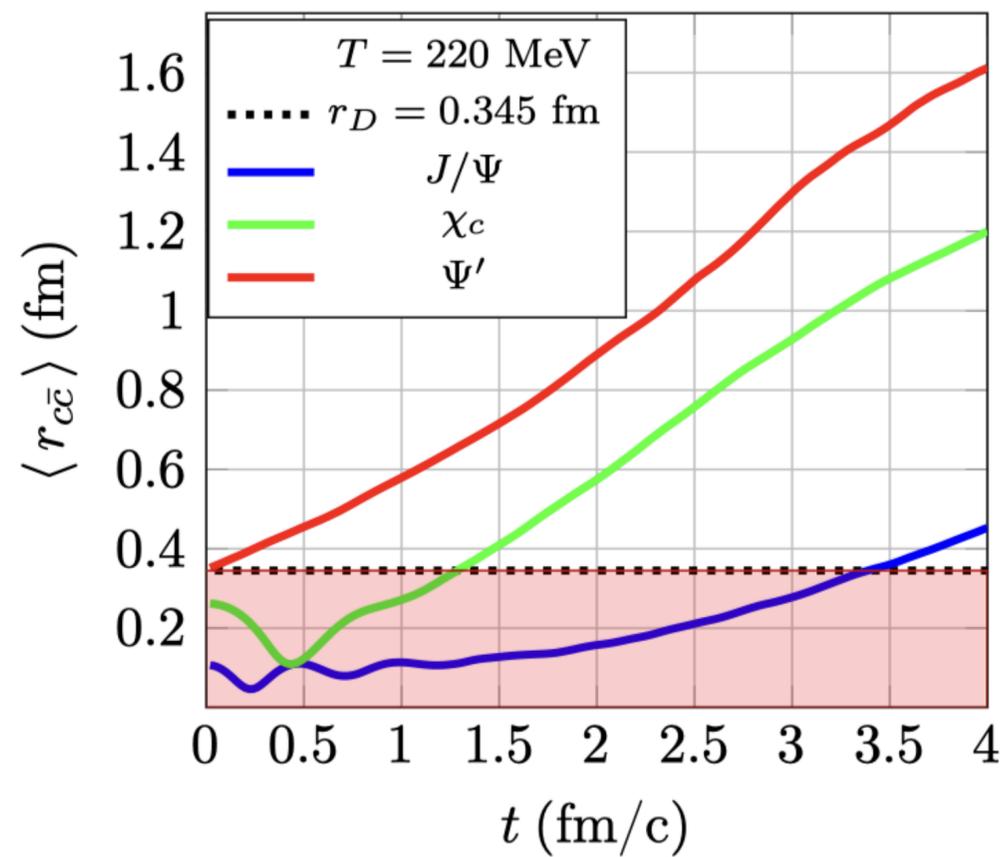

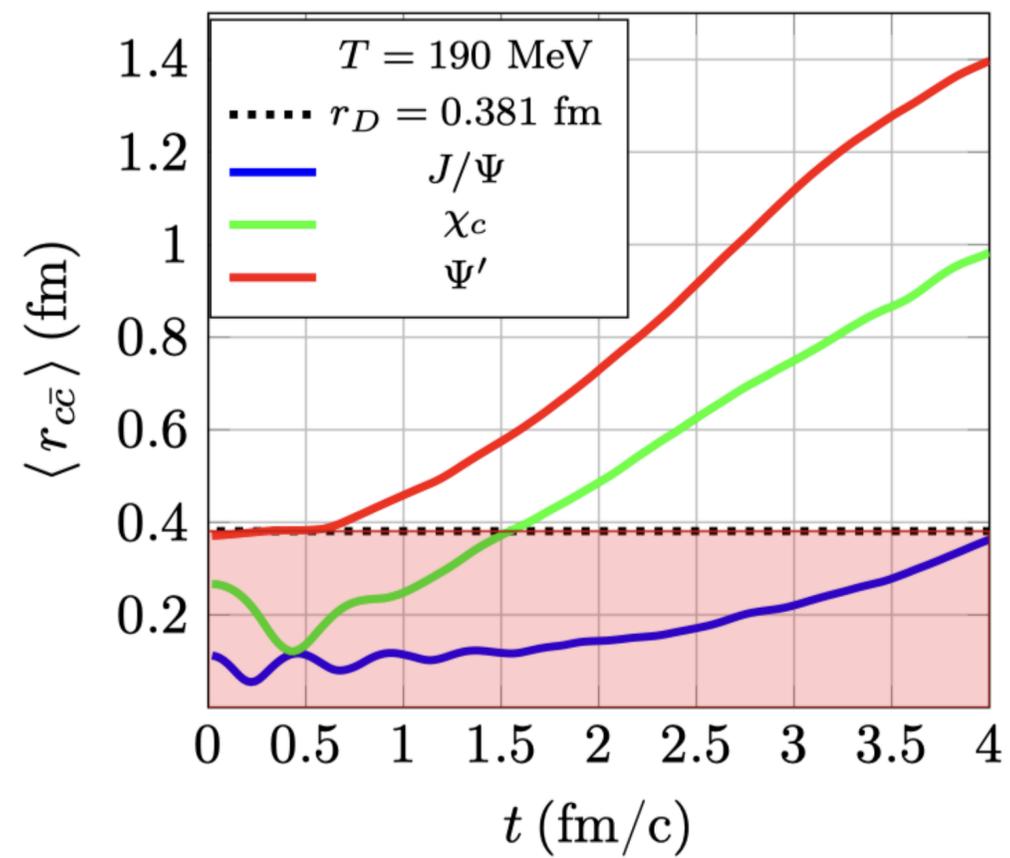

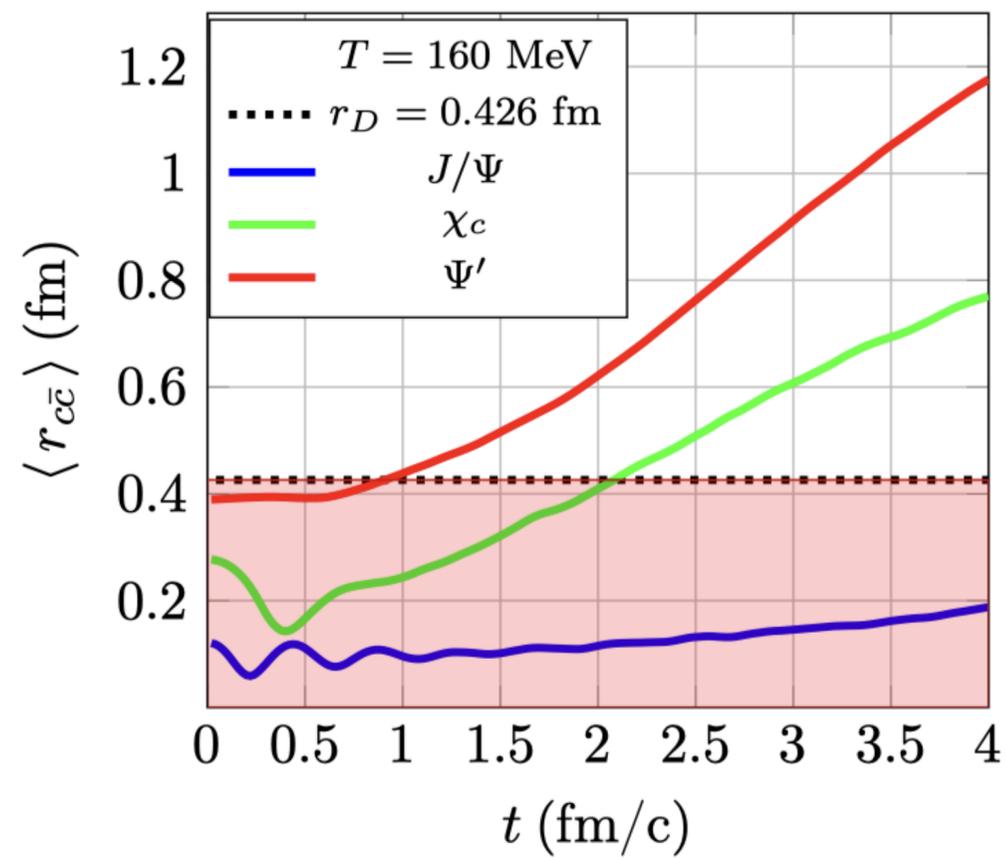

The semi-classical approximation allows for very detailed simulations  
(abelian plasmas)

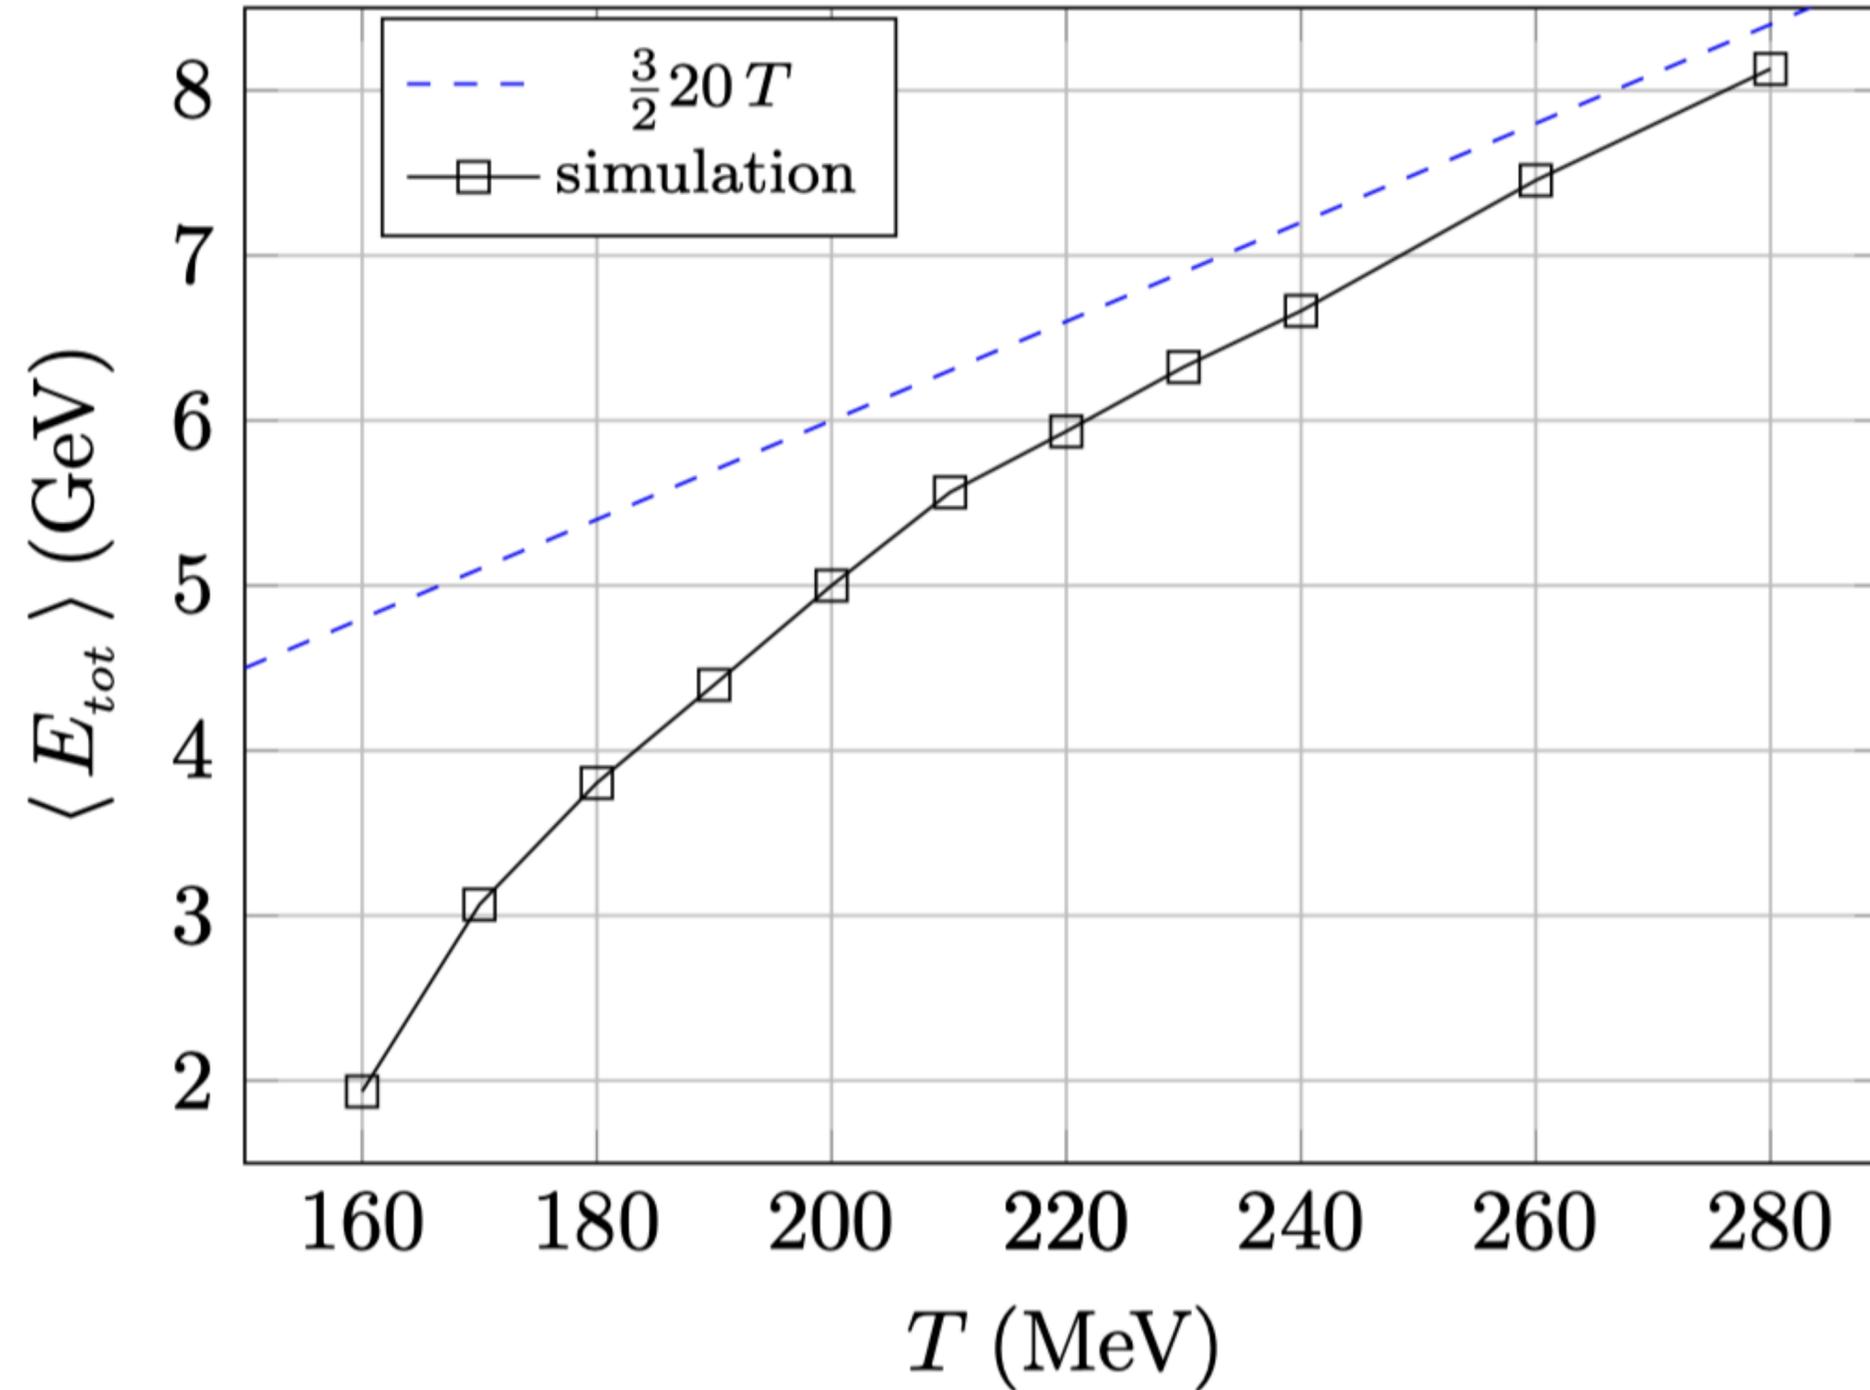

J-P.B, D. de Boni, P. Faccioli and G. Garberoglio, NPA (2016)

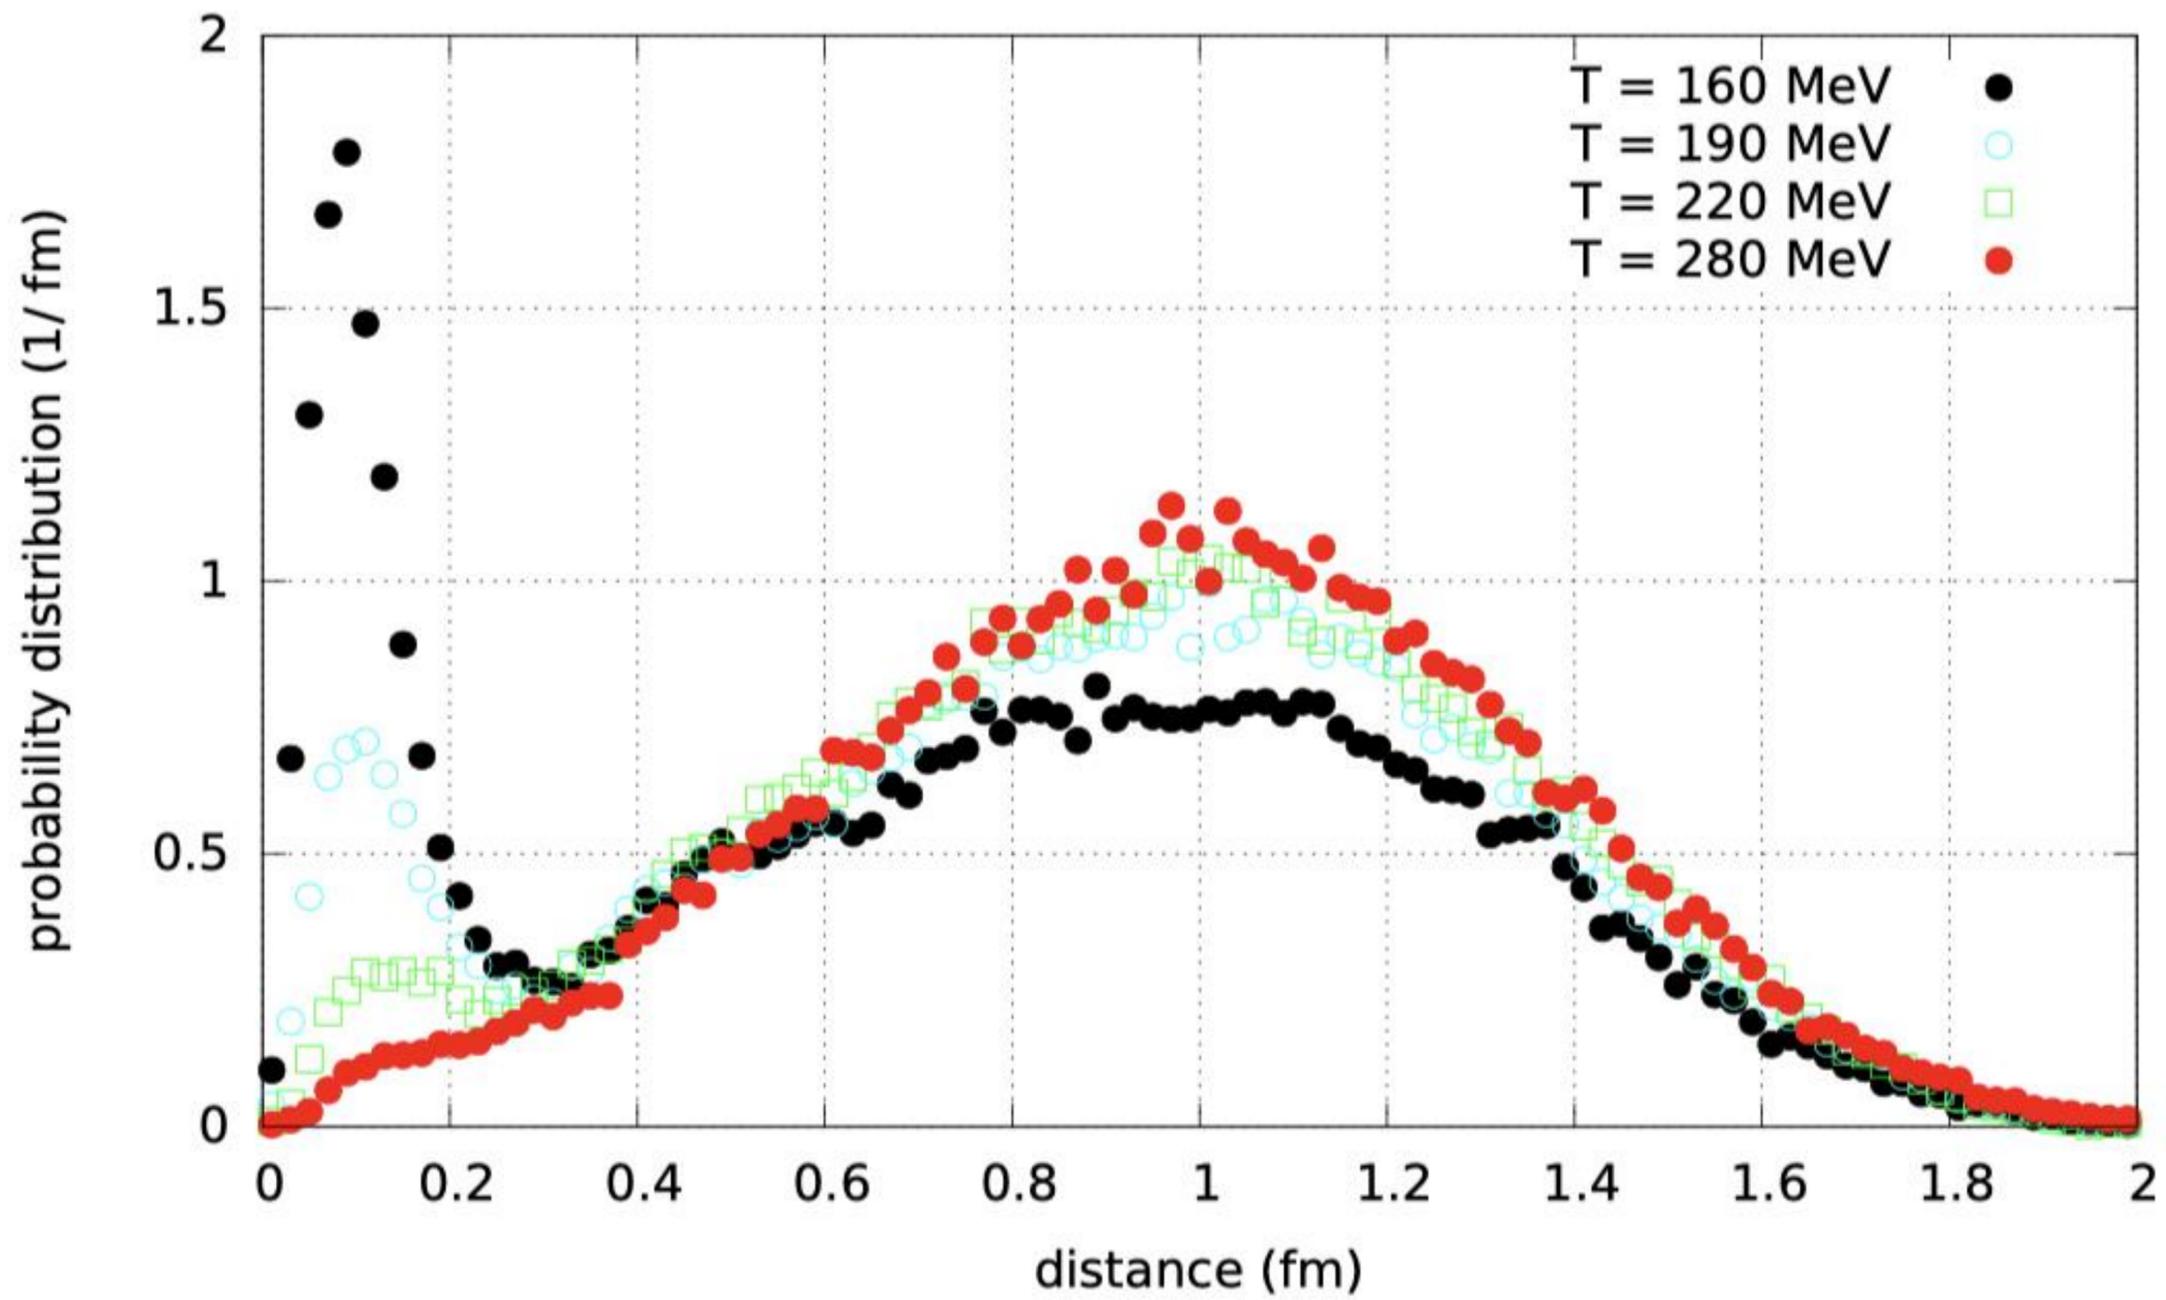

# Evolution of a single pair

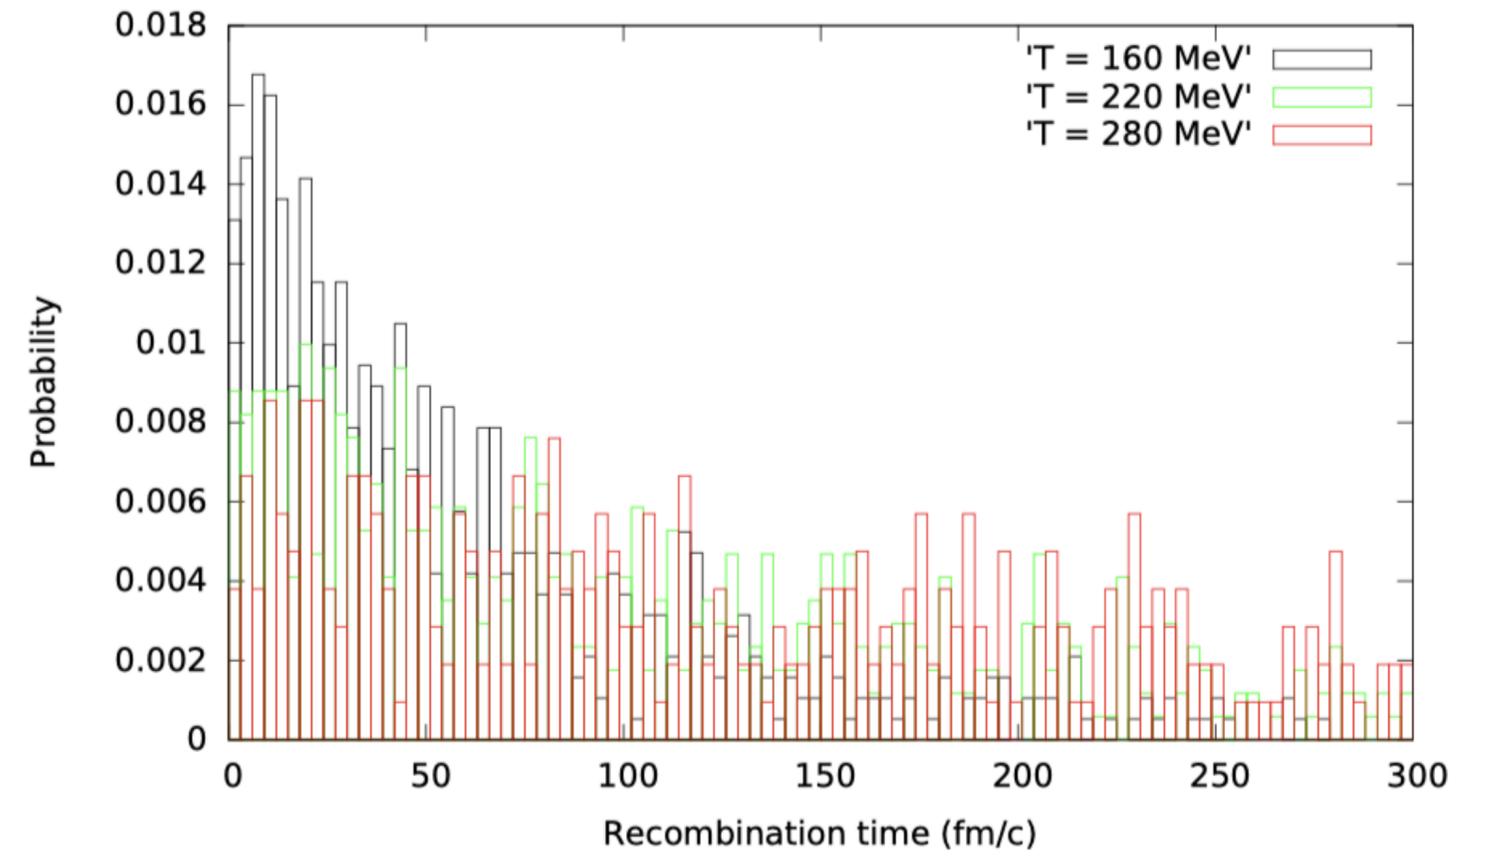

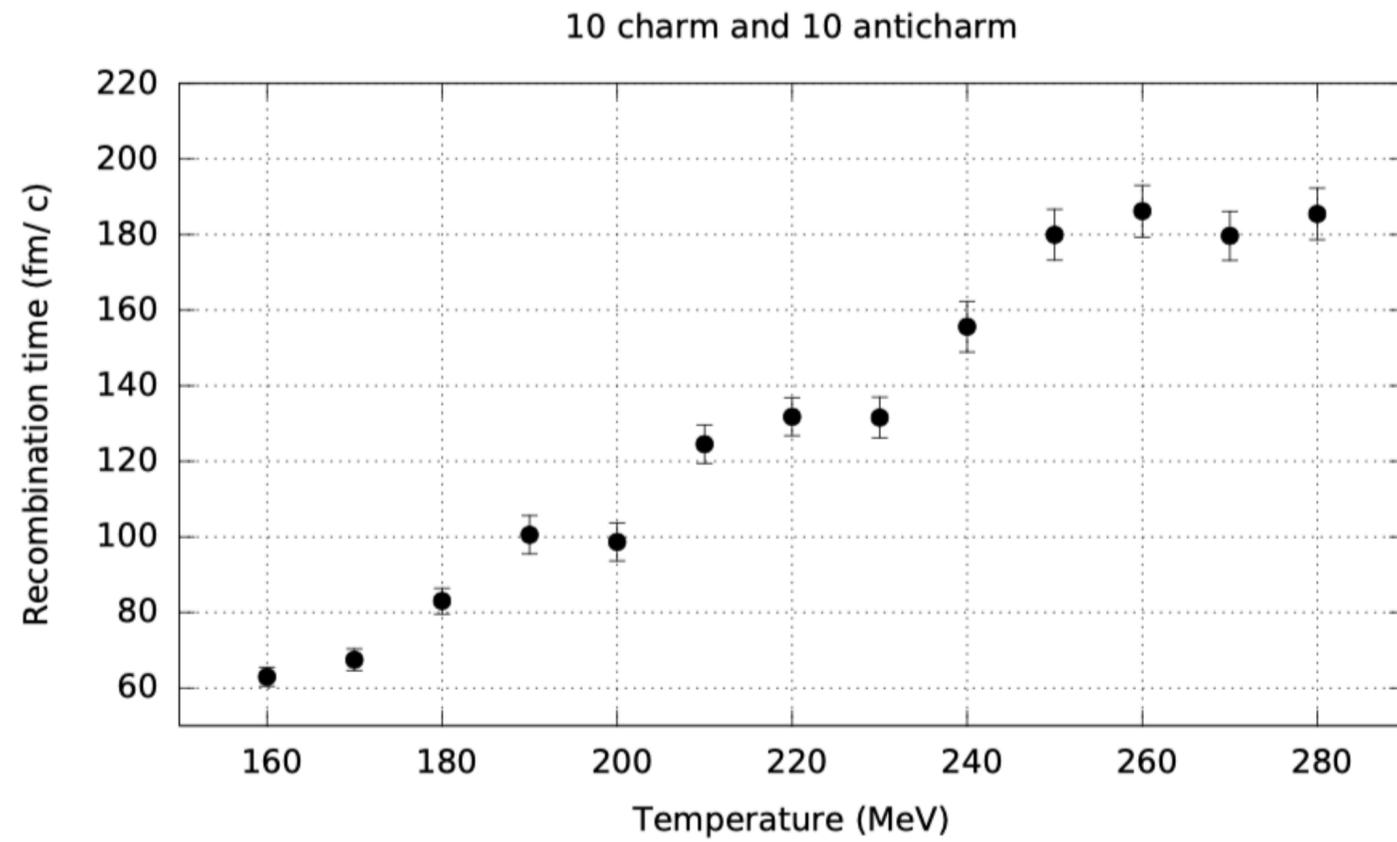

Evolution of 10  $c\bar{c}$  pairs

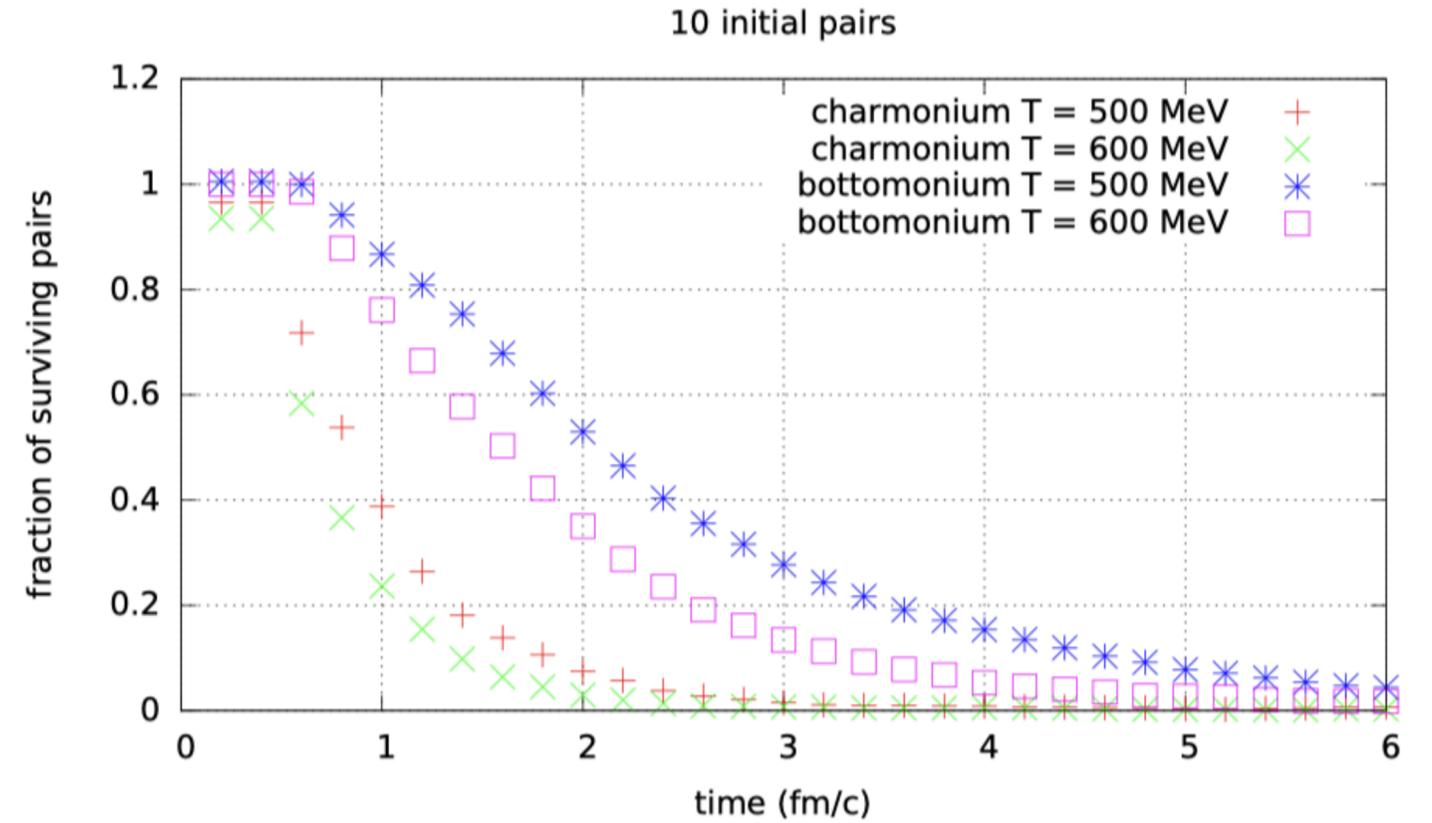

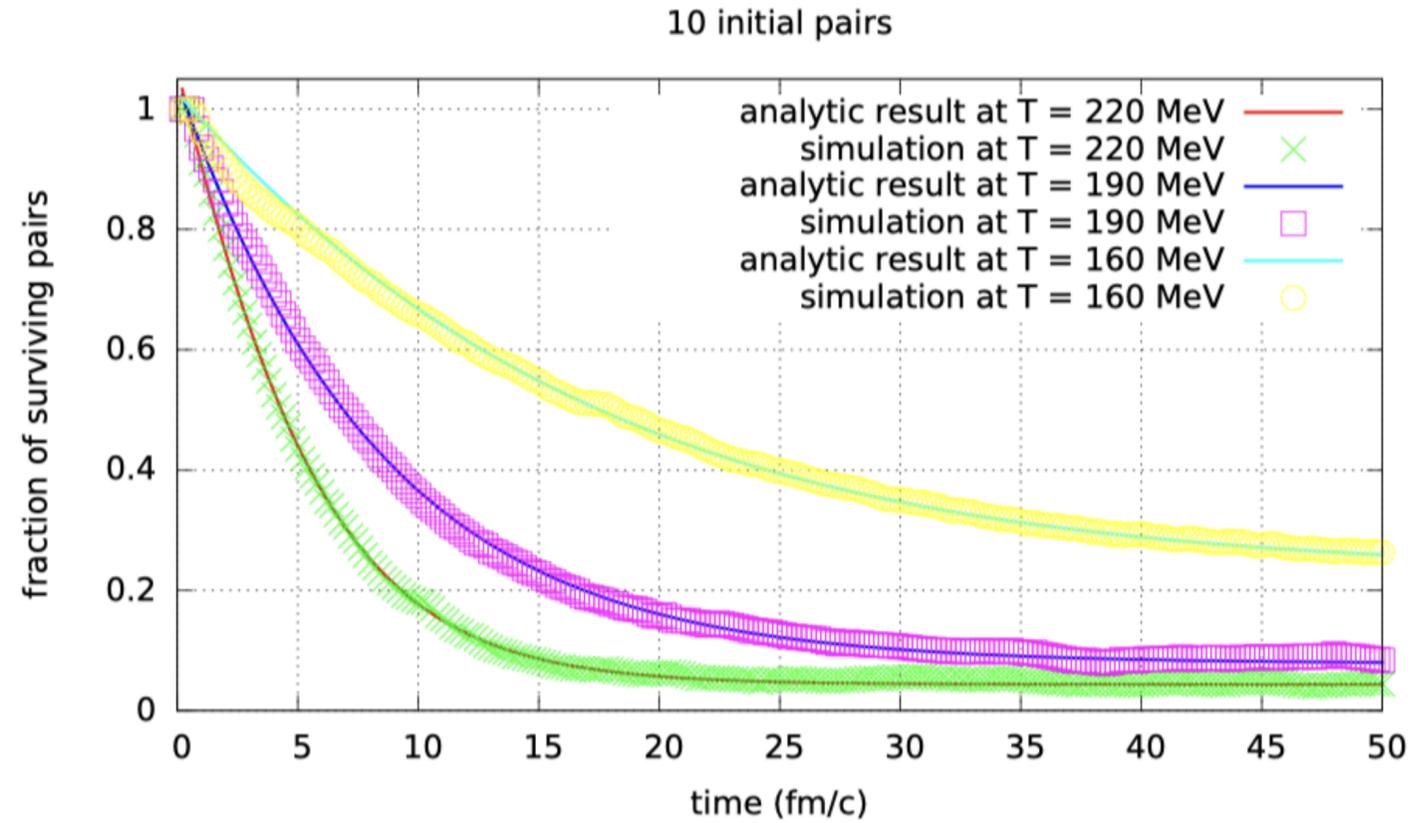

$$P_{q\bar{q}}^{\text{ideal}}(r) = \frac{3}{a} \left(\frac{r}{a}\right)^2 \left(1 - \left(\frac{r}{a}\right)^3 \frac{1}{N}\right)^{N-1} \underset{N \gg 1}{\approx} \frac{3}{a} \left(\frac{r}{a}\right)^2 e^{-(r/a)^3}$$

# Recombination time

# Recombination

$$\frac{dN(t)}{dt} = -\lambda_D N(t) + \lambda_R N_q(t) N_{\bar{q}}(t)$$
